# Introduction

This report provides an overview of your results after completing the Logical Reasoning test. The test measures your reasoning skills when dealing with abstract information. An overview of what the test measures, your result and what this means, is provided below.

The Logical Reasoning test assesses how quickly and accurately you can process abstract information, such as identifying patterns in a sequence. This type of reasoning ability is involved in tasks that involve more abstract information or data. Your result is based on the number of questions you answered correctly and how quickly you provided the correct answer. Your result is then compared to others' who have previously completed the assessment.

## Logical Reasoning

Taking into account the number of questions answered correctly, and the time taken for each correct answer, you scored above average on this reasoning test. An above average logical reasoning score indicates you are likely to perform better than most people in roles that place a strong emphasis on the interpretation of abstract data to draw logical conclusions.

This suggests that logical reasoning is one of your key strengths; you are likely to assess and interpret abstract data more quickly, accurately and effectively than most.
