

Practitioner Verbal Reasoning Report

Jan Przykładowy

03/02/2022

Introduction

This report provides an overview of the candidate's results after completing the Sova reasoning test. The test measures the candidate's reasoning skills when dealing with different types of novel information (written, numerical and/or abstract data).

Sova reasoning scores are based on both accuracy and speed. Although the tests are not time-limited, the time taken to make a response is recorded and taken into account in the score. The score is then compared to a norm group to give a percentile. This can be used to compare candidates and make selection decisions. An overview of what the test measures, the candidate's result and what this indicates, is provided below.

Verbal Reasoning

This test assesses how quickly and accurately the candidate can process novel verbal information and use it to draw the correct conclusions. This type of reasoning ability is involved in tasks that require making sense of large amounts of written information, such as interpreting written reports or documents.

Taking into account the number of questions answered correctly, and the time taken for each correct answer, the candidate scored in the average range on this reasoning test. This suggests they are likely to accurately interpret written information as quickly and effectively as most other people.
